

Product Brief — The Platform

Solar sales and installation management software Prepared for go-to-market, content/SEO, and website development partners · 8 September 2026

Note: no product name has been finalized yet — "The Platform" is a placeholder throughout. Worth knowing before locking in domain names, page titles, or meta tags.

1. Summary

The Platform is an operations system for companies that sell and install rooftop solar power systems. It carries a single job from first enquiry through to a commissioned, paid-for installation: capturing the enquiry, surveying the customer's roof, producing a priced customer proposal, converting the won deal into a delivery project, tracking the paperwork the electricity utility and government subsidy scheme demand, issuing materials from stock, recording the money, and reporting on all of it. It replaces the spreadsheets, chat groups and shared drives most solar installers run on today.

Built for solar installation and EPC (Engineering, Procurement, Construction) companies — it serves the whole staff: sales, surveyors, project managers, field technicians, storekeepers, accountants, and the owner.

The problem it solves: a rooftop solar deal is unusually long and document-heavy for its value. Between "yes, I want solar" and "the system is running" sits a chain of utility applications, government portal registrations, identity/property documents, inspections and approvals — any one of which can stall a deal for weeks. Most installers lose money not on the sale, but in the ninety days after it, because nobody can see which of two hundred live jobs is stuck and on whose desk. The Platform makes that visible and assigns it to a named person.

The five biggest capabilities:

1. Sales pipeline built for solar — solar-specific stages, bulk import, assignment, call logging, follow-ups, internal and channel-partner referral routes.
2. Site survey to priced proposal — structured roof/electrical survey on a phone, feeding a quotation engine that builds a priced bill of materials and a customer-ready proposal with savings and payback figures.
3. Configurable delivery workflows — an administrator defines the stage-by-stage checklist (including every document and utility step) a project must pass through; each live job is measured against it and stages are assigned to named staff.
4. Materials and stock — a catalogue with brands, price history, multiple storage locations, and a full movement ledger, connected to both quoting and execution.
5. Finance and reporting — a reviewed-and-approved money workflow with receivables, payables, ledgers, 21 operational reports, and a personal work queue per user.

Build maturity: Substantially built and demo-ready across sales, survey, quotation, workflow, materials, finance and reporting. Of 89 inventoried capabilities, **78 are live, 8 partial, 3 not built**. The gaps: consumer financing, a managed subsidy-claim workflow (currently checklist steps rather than its own module), after-sales service management, and any customer-facing access (no homeowner login).

2. What it is

Category. A vertical ERP with a CRM front end — industry-specific, not a general CRM with solar fields bolted on. Closest comparison: a field-service/construction management platform, narrowed to rooftop solar and extended into quoting, inventory and accounting.

Where it sits:

- Before the sale — the sales team's system of record.
- During the sale — the design and pricing tool (survey app + quotation engine).
- After the sale — the delivery control system (checklist, document store, stock issue point, assignment mechanism).
- Throughout — the finance and reporting layer.

It's meant to be the one system the company runs on, with a conventional accounting package downstream for statutory filing.

What it deliberately does not do:

- No array design — no shading simulation, 3D roof modelling, string-level electrical design, or yield modelling from satellite imagery.
 - No monitoring of installed systems — no connection to inverters or monitoring hardware.
 - Doesn't replace statutory accounting — hands structured data to a conventional package.
 - Doesn't market for you — no campaign builder, landing pages, or ad integration.
 - Doesn't face the customer — homeowners receive documents, not accounts.
 - No payroll/HR — records attendance only, no salary/leave calculation or recruitment.
-

3. How the solar business works

(Generic industry background for credible copy — not specific to any one company.)

The players: the installer/EPC company (the customer), the end customer (homeowner or business), the DISCOM (the regional electricity utility — nothing connects to the grid without its approval), channel partners (electricians, architects, agents working on commission),

distributors/manufacturers, government (sets the subsidy scheme, runs the national registration portal), and lenders.

The lifecycle of a solar deal:

1. **Enquiry** — from an ad, a partner referral, or a walk-in. Key qualifiers: monthly bill, roof, ownership.
2. **Qualification and first contact** — salesperson calls, gauges seriousness, gives a rough price. Most enquiries die here.
3. **Site survey** — usable roof area, roof type/structure, shading, electrical connection and sanctioned load, photos. Determines feasibility and system size.
4. **Design and quotation** — survey drives system size, which drives a bill of materials, which (plus margin/tax) becomes the proposal: price, expected generation, monthly saving, payback period.
5. **Negotiation and close** — customers compare 2–3 quotes; deals are won on price, brand, warranty, and belief the company will actually finish and secure the subsidy.
6. **Conversion and paperwork** — advance paid, contract signed; identity/ownership proof, electricity bill, bank details collected; DISCOM feasibility application and national subsidy portal registration begin.
7. **Approvals** — DISCOM confirms the connection can take the system. Mismatches (sanctioned load, name-on-account vs. property owner) each need separate correction applications.
8. **Procurement and delivery** — panels, inverter, structure and balance-of-system parts allocated and delivered.
9. **Installation** — mounting, panels, inverter/protection wiring, earthing. Days for a home, weeks for commercial.
10. **Inspection and meter change** — DISCOM inspects, replaces the meter with a bi-directional (net) meter.
11. **Commissioning** — formal switch-on and certification.
12. **Subsidy claim and closure** — commissioned system submitted for the government subsidy (paid to the customer post-inspection); final payment collected, warranty handed over, job moves to after-sales.

The commercial point: steps 6–12 are where installers bleed. The sale is over, the customer is impatient, cash is tied up in delivered material, and progress depends on third parties. A deal can sit for two months over one missing document. Visibility across that phase is the product's core value.

Key terms (full glossary at the end): kW, on-grid/off-grid/hybrid, net metering, BOM, DISCOM, sanctioned load, feasibility, commissioning, payback period.

4. Users

The Platform ships with ~24 predefined roles, grouped into commercially meaningful personas. Access is permission-based, not job-title-based, so companies can compose their own roles.

Persona	Does	Without the Platform
Business owner / director	Dashboards, report library — pipeline, conversion, delivery bottlenecks, money owed, rep performance	Finds out by asking people — late and flattering
Sales manager	Bulk assign/reassign, watches ageing/stalled deals, approves quotations, analyses lost deals	Can't enforce follow-up discipline or catch a bad quote
Sales executive	Logs calls, sets follow-ups, requests surveys, builds quotations, converts won deals	Works from memory/notebook; record leaves with them
Surveyor / site engineer	Structured survey on phone — roof, electrical, structural — photos, feasibility verdict	Survey data comes back as chat-group photos, re-keyed manually
Quotation specialist	Turns survey into priced proposal from the catalogue	Quoting is a spreadsheet per deal — slow, unauditable
Project manager	Works the stage checklist, assigns stages, chases documents/utility applications	Can't see which of many live jobs is blocked or why
Field technician / installer	Picks up assigned work, updates status, uploads evidence, records attendance	Work dispatched by phone call, completion unrecorded
Document collector	Chases paperwork, uploads and gets it verified against the right job	Paperwork phase has no owner, stalls invisibly
Storekeeper / materials manager	Maintains catalogue/stock, records receipts, moves stock, issues to projects	Stock is a guess, quotes priced off stale numbers
Accountant / finance manager	Reviews claims/expenses, invoices, receipts, vendor bills, ledger, exports	Finance works from bank statements, weeks behind

Persona	Does	Without the Platform
Administrator	Configures users, roles, workflow templates, survey forms, dropdowns	Every change needs a developer
Auditor / compliance reviewer	Read-only — activity trail, security event log	—
Channel partner (external)	Registers, submits/tracks enquiries, sees commission status	Enquiries arrive by phone, disputes settled from memory
Support handler	Receives/resolves internal tickets against projects and system issues	—

5. Modules

5.1 Lead and enquiry management — LIVE Enquiry creation or bulk spreadsheet import (with preview, row-level accept/reject, batch history). Solar-specific pipeline stages beyond generic new/won/lost (discussion, document collection, survey, feasibility, proposal, commitment, plus not-feasible / not-interested / already-has-solar outcomes). Bulk assign/reassign with change preview, collaborators, duplicate checks, priority, property type, a unified related-records view, call logging, internal follow-up Q&A on a deal. *Benefit:* no enquiry forgotten, activity visible, pipeline is fact not opinion.

5.2 Contact directory and call logging — LIVE Per-deal/per-project contact lists; local, shared-directory, or promoted contacts; primary/archived status. Click-to-dial from the user's own phone with an outcome-capture prompt at call time. (Not a call centre — uses the user's own phone, doesn't record audio.) *Benefit:* accurate contact record without asking staff to write it up.

5.3 Referrals — LIVE Any employee submits a lead; a manager reviews, dedupe-checks, assigns, and converts it. Referral and commission status tracked per employee; performance reporting on who generates business.

5.4 Channel partner portal — LIVE (*commission tracking PARTIAL*) Self-service partner area: sign-up, email verification, login, password recovery. Partners submit enquiries, track progress, see commission status, export activity history. Internally: admin approves/suspends accounts, reviews/dedupes/converts enquiries, progresses commission through pending → approved → paid with a reference. Full dated event history. Publishable on the company's own web address. *Partial:* commission is recorded and marked paid manually — not calculated or moved automatically.

5.5 Site surveys — LIVE Scheduled against an enquiry, assigned to a surveyor (date/time/priority), worked from a phone. Configurable form covering site/access, roof type/age/area/tilt/orientation/shading, electrical connection and sanctioned load, structural details. Category-tagged, location/time-stamped photos. Recommended capacity, panel/inverter type, feasibility verdict. Reschedule (with reason, tracked), cancel, annotate, complete, print. Capacity-assist suggestion tool. *Benefit:* quotes based on the roof that exists, not what the customer said on the phone.

5.6 Quotations and customer proposals — LIVE Started from a qualified enquiry + completed survey (eligible ones are listed). System configuration → auto-assembled priced parts list from the live catalogue, editable/extendable manually; commercial position updates live. Lifecycle: draft → sent → viewed → accepted/rejected/expired, with a separate approval track (draft → pending → approved/rejected) — nothing sends unapproved. Superseding creates a new revision, not an overwrite; full event history; concurrent-edit protection. Output: a designed, print-ready proposal (system overview, current electricity position, generation/savings projection, cost, payback, milestone payment schedule, terms) in subsidised and non-subsidised variants. Also: a modelling workspace for pre-commit previews, and an import tool that reads an existing quotation document and extracts line items with a confidence score. *Benefit:* consistent, defensible pricing; nothing unapproved reaches a customer; the document looks like it came from a serious company.

5.7 Customers and conversion — LIVE Converting a won deal is one action: creates the customer record, opens a delivery project against the accepted quotation, records the advance, moves all collected documents across, marks the enquiry won, and starts the right delivery workflow (on/off-grid, subsidy/financing in scope or not). *Benefit:* the sales-to-delivery handover happens once, completely.

5.8 Projects — PARTIAL Every converted deal has a project (number, customer, quotation value, capacity, type, owner, expected completion, subsidy/financing/utility flags). Status: feasibility → pre-execution → material delivery → installation → commissioning → handover → completion, plus on-hold/cancelled. *Why partial:* projects are only created by converting a won deal — no direct creation, no explicit close/archive action. Day-to-day execution isn't driven from this screen; it's driven from Business Flows (5.9). No Gantt chart, resource-levelled schedule, or critical path.

5.9 Business flows (the delivery engine) — LIVE The most distinctive capability. An administrator defines a template of stages, each containing items of four kinds: checklist tick, document to collect, data field, or action. Items can be required or optional; templates differ by project type and by whether subsidy/financing/utility approval apply. On conversion, the right template instantiates as a live flow; items are completed, waived, marked N/A, or rejected, with notes and attached documents. Shipped templates cover a full grid-connected journey (utility feasibility, document collection, load-enhancement/name-correction sub-processes, national subsidy portal registration, financing, material delivery, installation, utility registration/inspection, commissioning, final subsidy submission, closure) and a shorter off-grid journey. Both fully editable, no developer needed. *Benefit:* the company's own process becomes the software — a manager can see exactly which of 200 jobs is stuck and where.

5.10 Jobs and work assignment — LIVE A manager assigns a set of stages from a live flow to a person as a job, with a note. Reassignable, cancellable, completable; stages added/removed; full event history. Stages lock to one job at a time. *Benefit:* delivery work has a named owner and a completion record instead of a phone dispatch.

5.11 Tasks — LIVE General-purpose task management alongside the structured flows — priority, due date, comments, status (pending/in progress/blocked/completed/cancelled), archiving. Admin-maintained templates for recurring work; team overview for managers; per-task activity history.

5.12 Reminders — LIVE (*WhatsApp delivery PARTIAL*) Attachable to almost any record. One-off and recurring schedules, multiple recipients, priority, rescheduling, per-occurrence tracking. Admin-maintained templates with version history. Delivery: in-app + email by default, plus a delivery log, an operations report, and a channel-health view. *Why partial:* WhatsApp delivery exists but needs an external messaging service connected — inactive out of the box.

5.13 Notifications — LIVE In-app with unread count, plus browser push. Read/dismiss/archive; admin broadcast; logged delivery.

5.14 Documents — LIVE Single store for everything collected — uploaded against an enquiry, customer, project, flow item, subsidy record, or call. Typed, titled, tagged, verification state (pending/verified/rejected) restricted to permitted users. Search, filter, secure preview/download, metadata update, permissioned delete. Documents can attach directly to the checklist item requiring them, so "what's missing" is answerable at a glance. *Not present:* e-signature, automatic expiry tracking.

5.15 Document templates — LIVE Reusable templates, previewed and generated as print-ready files. Default set installable.

5.16 Materials, stock and purchasing — LIVE (*purchasing PARTIAL*) Full catalogue (panels, inverters, batteries, cable, structure, earthing, BOS, meters, fasteners, kits, consumables, controllers, conduit, accessories, services, packages) with category/brand/spec/tax classification. Price book with history (past quotations keep their original price). Multi-location stock (main store, branch, site, vehicle, temporary) as a full movement ledger — opening balances, receipts, transfers, issue/return, reservations, adjustments, damage/loss. Vendor mapping. Purchase invoice recording with attachment. Serial number visibility (view-only). Admin-maintained parts-list rules translating a configuration into a parts list. *Why partial:* no purchase orders (purchasing starts at the invoice); serials are view-only, not scanned; no automatic low-stock alerting.

5.17 Finance and accounts — LIVE Reviewed money workflow: any permitted employee raises a claim (income/expense/reimbursement/payment request/refund/adjustment) with evidence; moves through verification, clarification request, approval/rejection, posting, reversal. Withdrawable while unverified, reviewer-correctable, reorderable; posting preview before commit. Receivables (invoices, receipts, ageing) and payables (bills, payment requests, ageing). Full ledger with asset/liability/equity/income/expense structure; payment accounts/modes (cash, bank transfer, instant transfer, cheque, card, wallet); stock valuation

entries; service finance record. Admin-configurable categories, ledger accounts, approval configuration. Imports: opening balances, customer/vendor opening balances, bank statements. Exports: spreadsheet + structured files for accounting packages, with export history. Finance dashboard, per-project/per-enquiry reports.

5.18 Attendance — LIVE Time in/out with device/network context. Status: present/absent/missing-time-out/manually-adjusted/leave/holiday. Admin adjustment (with note) and approval. Personal view, per-user stats, company-wide view, queued export. *Not present*: not GPS/photo-verified; no pay calculation or leave-balance management.

5.19 Support tickets — PARTIAL Raised with type/title/description/priority, optionally linked to a project; assigned, worked, resolved through open → in progress → resolved → closed. *Why partial*: oriented to staff-raised issues, not a full after-sales desk — no SLA tracking/escalation, no customer-facing submission, no scheduled service visits, no warranty-claim workflow.

5.20 Add-ons — LIVE A hub: quick quotation generator (fast printable estimate, deliberately separate from formal quoting so an estimate is never mistaken for a committed price), material scenario builder (models a configuration against the catalogue before it becomes a quotation, with export), document template manager, contact directory. More tools planned.

5.21 Reporting — LIVE — see Section 8.

5.22 Dashboard and personal work queue — LIVE Dashboard: enquiries by stage/type, active/overdue surveys, projects by status, active/overdue tasks, pending/overdue project materials, pending finance claims, open tickets by status/priority, pending documents, attendance — several with period-over-period movement. "My Work" gives each user a personal view (overdue follow-ups, scheduled visits, documents awaiting verification, finance ageing) with metrics and trend; managers can open a team member's view for factual one-to-ones.

5.23 Administration — LIVE Users/roles: create users, assign multiple roles, edit permissions across the full set, control which reports/work-queue views a role sees; multi-role users switch roles in session. Company settings: status values, dropdown lists, survey templates. Audit: full activity trail (what/who/when/where), browsable by entity/user, with stats and export; separate security event log; sensitive-data access record.

5.24 In-app assistant — PARTIAL Answers "how do I do this" questions, aware of the user's role/permissions/current screen. Personal details typed into it are stripped before processing. *Why partial*: separately deployed service, must be connected/configured — unavailable where not connected. Answers usage questions only, not questions about the business's own data; performs no actions.

5.25 Consumer financing — NOT BUILT A placeholder loan record and checklist financing stages exist on conversion, but there's no loan management screen — no lender panel, application tracking, repayment schedule, or disbursement record. Groundwork exists but isn't user-reachable.

5.26 Subsidy claim management — PARTIAL A subsidy record is created on conversion when subsidy is in scope; documents file against it; the delivery checklist carries the full national-portal/utility sequence. Secure per-customer store for national portal credentials, access-restricted and logged. *Why partial:* no dedicated subsidy screen — no scheme catalogue, eligibility check, application status board, or approved-vs-disbursed tracking. Followed through the checklist rather than managed as its own object.

5.27 Customer portal — NOT BUILT No end-customer login. Customers receive documents; they can't log in to see progress. The only self-service portal is for channel partners.

6. Key workflows

A — Enquiry to booked site survey [complete] Bulk spreadsheet import with preview/dedupe → bulk assignment with preview → salesperson works their personal queue, calls, logs outcomes → enquiry moves through stages → survey requested and scheduled with a reminder → technical questions raised as internal follow-ups and answered on record.

B — Survey to approved proposal [complete] Surveyor completes the phone-based form (roof, shading, electrical, structure), photographs each area with time/location stamps, records recommended capacity and feasibility verdict. Quotation started from that enquiry+survey; system configured; priced parts list assembled from the catalogue; specialist adjusts; submitted for approval; manager approves; only then sent. Customer receives the full proposal (system, generation/saving, payback, subsidised/unsubsidised price, payment schedule).

C — Winning the deal and starting delivery [complete] Acceptance recorded, deal converted — in one action: customer created, project opened against the accepted quotation, advance recorded, documents carried across, enquiry marked won, correct delivery checklist started (grid-connected/off-grid, subsidy/financing in/out). PM sees the full sequence ahead and assigns first stages as jobs.

D — Working a job through delivery [complete] Document collector chases and uploads paperwork against the exact checklist item requiring it; each verified/rejected. A stage can't finish while a required item is outstanding, so a stalled job stays visible. Reminders chase owed items. Utility/portal steps are ticked off with reference details recorded. Storekeeper issues material (recorded against stock). Field staff complete installation and record attendance. PM sees exactly which stage each job is on and who owns it.

E — Money in and money out [complete] Advance recorded at conversion → invoices raised, receipts recorded with ageing visibility → expense/reimbursement claims submitted with evidence, verified/clarified/approved, posted with a preview and reversal path → vendor bills and payment requests → period-end export to the accounting package.

F — Partner-originated business *[complete, with a manual step]* Partner registers, verifies email, logs in, submits an enquiry → partner manager reviews/dedupes/converts (or rejects) → follows Workflow A → partner watches progress, adds remarks → on win, manager sets, approves, then marks commission paid with a reference. *Incomplete:* commission amount is entered manually, not calculated from a scheme; payment happens outside the system and is only recorded here.

G — After commissioning *[incomplete]* Final subsidy submission and closure/support stage on the checklist; documents handed over. Beyond that: a support ticket can be raised and assigned, but there's no SLA clock, scheduled maintenance, warranty-claim handling, or customer self-reporting. The weakest part of the journey — don't position this as a service management capability.

7. Feature inventory

89 features inventoried — **78 LIVE, 8 PARTIAL, 3 NOT BUILT**. Every feature was confirmed against the actual implementation, not a menu entry.

#	Feature	Area	Maturity
1	Enquiry capture and detail record	Sales	LIVE
2	Solar-specific pipeline stages	Sales	LIVE
3	Bulk spreadsheet import with preview/row selection	Sales	LIVE
4	Import batch history	Sales	LIVE
5	Duplicate detection before create	Sales	LIVE
6	Single and bulk assignment with preview	Sales	LIVE
7	Collaborators on an enquiry	Sales	LIVE
8	Related records view	Sales	LIVE

#	Feature	Area	Maturity
9	Call logging with outcome	Sales	LIVE
10	Per-record contact directory	Sales	LIVE
11	Shared company directory (promote/import)	Sales	LIVE
12	Click-to-dial with capture prompt	Sales	LIVE
13	Internal follow-up questions on a deal	Sales	LIVE
14	Personal follow-up scheduling	Sales	LIVE
15	Employee referral submission and conversion	Sales	LIVE
16	Referral commission status tracking	Sales	LIVE
17	Partner self-service registration/login	Partner	LIVE
18	Partner enquiry submission and tracking	Partner	LIVE
19	Partner commission visibility	Partner	LIVE
20	Partner administration, approval, suspension	Partner	LIVE
21	Partner enquiry review/dedupe/conversion	Partner	LIVE
22	Commission set/approve/mark paid with reference	Partner	PARTIAL

#	Feature	Area	Maturity
23	Partner portal on company's own web address	Partner	LIVE
24	Partner activity audit and export	Partner	LIVE
25	Survey scheduling and assignment	Survey	LIVE
26	Configurable survey forms	Survey	LIVE
27	Structured roof/electrical/structural capture	Survey	LIVE
28	Location-stamped photo capture by category	Survey	LIVE
29	Feasibility verdict and recommended system	Survey	LIVE
30	Capacity assist from survey inputs	Survey	LIVE
31	Reschedule with reason, cancel, notes, print	Survey	LIVE
32	Quotation build from enquiry and survey	Quoting	LIVE
33	Automatic priced parts list from catalogue	Quoting	LIVE
34	Manual line item editing and extras	Quoting	LIVE
35	Approval workflow before sending	Quoting	LIVE
36	Revisions preserving previous versions	Quoting	LIVE

#	Feature	Area	Maturity
37	Quotation status lifecycle and event history	Quoting	LIVE
38	Customer proposal document	Quoting	LIVE
39	Quotation modelling workspace	Quoting	LIVE
40	Import line items from an existing quotation file	Quoting	LIVE
41	Quick estimate tool with printable output	Add-ons	LIVE
42	Material scenario modelling with export	Add-ons	LIVE
43	One-step conversion of a won deal	Delivery	LIVE
44	Customer record with linked history	Delivery	LIVE
45	Project register with status and value	Delivery	PARTIAL
46	Configurable delivery workflow templates	Delivery	LIVE
47	Live per-job checklist with four item types	Delivery	LIVE
48	Stage assignment to staff with locking	Delivery	LIVE
49	Job execution, completion, event history	Delivery	LIVE

#	Feature	Area	Maturity
50	Task management with templates and comments	Delivery	LIVE
51	Document upload against any record/checklist item	Documents	LIVE
52	Document verification and rejection	Documents	LIVE
53	Document template creation and generation	Documents	LIVE
54	Materials catalogue with brands/specifications	Materials	LIVE
55	Price book with history	Materials	LIVE
56	Multi-location stock with full movement ledger	Materials	LIVE
57	Vendors and vendor-material mapping	Materials	LIVE
58	Purchase invoice recording with attachment	Materials	PARTIAL
59	Serial number visibility	Materials	PARTIAL
60	Parts-list rules configuration	Materials	LIVE
61	Claim workflow: submit/verify/approve/post/reverse	Finance	LIVE
62	Customer invoices, receipts, ageing	Finance	LIVE

#	Feature	Area	Maturity
63	Vendor bills, payment requests, ageing	Finance	LIVE
64	Ledger and finance configuration	Finance	LIVE
65	Opening balance and bank statement import	Finance	LIVE
66	Export to accounting package with history	Finance	LIVE
67	Stock valuation entries	Finance	LIVE
68	Attendance time in/out, adjust, approve, export	People	LIVE
69	Reminders on any record, recurring, with history	Productivity	LIVE
70	Reminder templates with version history	Productivity	LIVE
71	Reminder delivery by messaging app	Productivity	PARTIAL
72	In-app notifications and browser push	Productivity	LIVE
73	Personal work queue	Productivity	LIVE
74	Manager view of a team member's queue	Productivity	LIVE
75	Operating dashboard	Insight	LIVE
76	Report library of 21 reports	Insight	LIVE

#	Feature	Area	Maturity
77	Report export with queued large exports	Insight	LIVE
78	Support ticket raise, assign, resolve	Support	PARTIAL
79	Users, multi-role assignment, role switching	Admin	LIVE
80	Fine-grained permissions incl. per-report access	Admin	LIVE
81	Configurable statuses, dropdowns, forms	Admin	LIVE
82	Activity trail with export	Admin	LIVE
83	Security event log	Admin	LIVE
84	Secure per-customer portal credential store	Admin	LIVE
85	In-app how-to assistant	Support	PARTIAL
86	Subsidy record and document filing	Delivery	PARTIAL
87	Consumer financing management	Finance	NOT BUILT
88	Customer self-service portal	Customer	NOT BUILT
89	Electronic signature	Documents	NOT BUILT

8. Reporting and insight

What it tells an owner they couldn't easily know otherwise: which enquiries are going stale and whose they are; why deals are actually lost (aggregated, not verbal); which lead sources

are worth the money; how each salesperson really performs; where quotations die and how long each stage takes; which jobs are stuck in delivery and at which step; what's owed, by whom, how late; whether follow-up discipline is real; whether partners are worth their commission; whether surveys are on time.

The report library — 21 reports, individually permissioned:

- *Sales*: sales performance overview, verified lead activity, lead activity, lead funnel, lead ageing, sales rep scorecard, lost and cold analysis, source performance, internal referral performance, internal follow-ups
- *Quotation*: quotation pipeline, quotation cycle
- *Operations*: site surveys, project status, task operations, support tickets, reminder operations
- *Finance*: finance claims, accounts ageing, accounts export history
- *People and partner*: attendance summary, partner leads and commissions, user and role activity

Documents and exports: the customer proposal (subsidised/unsubsidised), a quick-estimate document, printed survey output, generated operational documents, report exports (spreadsheet + print-ready, queued for large sets), accounting exports, attendance exports, audit/partner activity exports.

9. Practical characteristics

- **Works on a phone in the field** — responsive interface, no separate app to install (mobile browser, not an app-store app).
- **Photo capture with location** — survey photos carry where/when taken.
- **Requires a connection** — no offline mode. A genuine limitation for rural work.
- **Many users, many roles** — unlimited named users, multiple roles each, switchable in session.
- **Access control genuinely enforced** — permissions checked server-side on every action, not just hidden buttons. ~300 distinct rights across ~30 areas, including per-report and per-work-view access.
- **Configurable without a developer** — workflow templates, survey forms, statuses, dropdowns, task/reminder templates, finance categories/accounts are all admin-editable.
- **Multiple physical locations** — stock across stores, branches, sites, vehicles, temporary locations.
- **One company per installation** — doesn't currently partition multiple unrelated companies in one install.
- **Built for the Indian rooftop solar market** — terminology, document types, tax treatment, utility sequence, subsidy process reflect Indian practice. Single currency/language today.
- **Alerts reach people who aren't logged in** — browser push and email.
- **Full activity trail** — material changes recorded and exportable (user, time, origin).

- **Bulk data in and out** — spreadsheet import; reports/finance/attendance export; large exports queued.
 - **No public integration interface** — no documented API for external systems; integration today is import/export files.
-

10. Pricing structure inputs

Units the product naturally meters, roughly by how well each tracks delivered value:

1. **Named users** — the most natural unit; a salesperson/accountant lives in it all day, a field technician only receives assigned work (supports a full-user/light-user split).
2. **Live projects / projects converted per period** — tracks actual business volume; fairest measure since delivery is where the product earns its keep.
3. **Quotations produced** — a good sales-activity proxy, though metering it risks discouraging the behaviour the product exists to encourage.
4. **Document storage volume** — a real, growing cost and a fair overage unit.
5. **Physical locations** — stores, branches, warehouses.
6. **Channel partner accounts** — a distinct, countable population; a natural add-on.
7. **Generated customer documents** — proposals and operational paperwork.

Users + a project/installation-volume band is the most defensible combination — it aligns with ability to pay and cost to serve.

Natural tier boundaries (each usable without the one above it):

- **Sales layer** — enquiries, contacts, call logging, follow-ups, referrals, tasks, reminders, notifications, personal work queue, basic dashboard, sales reports. Replaces a general CRM outright.
- **Sales and quoting layer** — adds site surveys, materials catalogue/price book, the quotation engine and approval workflow, the customer proposal document. The natural mainstream tier — where most buyers land.
- **Full operations layer** — adds customer/project conversion, configurable delivery workflows, job assignment, document management, stock movement/locations. For companies running meaningful installation volume.
- **Finance layer** — claims/approvals, receivables/payables, ledger, accounting exports. A natural separate tier (different internal buyer; many customers already own an accounting package).
- **Add-on modules** — the channel partner portal is the clearest standalone add-on (own external user population, own web address). Attendance, the in-app assistant, and the advanced reporting library are also separable.

The permission system already supports selling this way — reports, add-ons and work views are individually grantable, so tiers can be enforced without code changes.

11. Competitors

(All readings below are general market knowledge, not a formal competitive analysis — verify current positioning/pricing before publishing.)

Competitor	What it is	Where The Platform is stronger / weaker
Aurora Solar	Design/sales platform: roof modelling, shading, yield simulation, proposals	Weaker on design (no modelling/simulation at all). Stronger after the sale — Aurora largely stops at the proposal.
OpenSolar	Free design/proposal tool, hardware-sales monetisation, strong internationally	Weaker on design and on price (free at point of use). Stronger on operations depth and Indian utility/subsidy fit.
Scoop Solar	Field ops and project workflow for installers	Closest in intent. Stronger on quoting/materials/finance being in one system. Weaker on offline field capability, which Scoop treats as central.
ServiceTitan / Jobber	General field-service management for trades	Weaker on scheduling/dispatch/service management (their core strength). Stronger on everything solar-specific — sizing, BOMs, utility/subsidy tracking.
Zoho CRM / Salesforce + solar overlay	General CRM configured for solar	Weaker on ecosystem/integrations/maturity/familiarity. Stronger on being ready for a solar business day one.
Sales Simplicity / Enerflo	Sales-cycle orchestration for solar, largely US-focused	Weaker on integration breadth. Stronger on covering physical delivery and Indian market fit.

Genuine differentiators, as outcomes:

1. **The company's own delivery process becomes the software.** Most competitors offer a fixed pipeline; here an admin defines the exact stages/documents/data/actions a job must pass through, and every live job is measured against it — answering "which of 200 jobs is stuck, at which step, whose desk" in seconds.
 2. **One system from first call to final payment.** Enquiry through reporting are the same system, same records — no re-keying, no reconciliation, a genuinely complete customer history.
 3. **Quotes priced from live cost data, with price history preserved.** Quotes stop being wrong because someone used last year's spreadsheet.
 4. **Built around the paperwork, not despite it.** Utility applications, portal registrations, inspection steps are first-class workflow items with owners and completion states — not attachments in a folder.
 5. **Ready for this market on day one.** Vocabulary, document types, project types, utility sequence, subsidy steps already there — weeks of configuration, not months of implementation.
 6. **Partners are inside the system.** Self-registration, self-tracking, visible commission — arrives complete and traceable rather than as a phone call.
-

12. Strengths and gaps

Demo-ready today: the strongest path is the full journey — import a batch of enquiries, work one through a survey on a phone, build the quotation, produce the proposal, convert the deal, watch the delivery checklist appear fully populated. Also strong: the permission/role screens, the workflow template designer, the report library, the materials catalogue and stock ledger, the finance approval chain, and the personal work queue (lands well with owners — makes accountability concrete). The finance module in particular is more complete than buyers will expect.

What buyers will expect and not find:

- **A customer portal** — homeowners increasingly expect to track their install; there's nothing.
- **After-sales service management** — any installer with an installed base will ask; there's a ticket log and nothing more.
- **Consumer financing** — a significant share of residential solar is financed; no loan module.
- **Subsidy as a managed process** — buyers will expect a status board with approved/disbursed amounts; today it's checklist steps.
- **Offline field capability** — surveyors work in low-signal areas; competitors make a feature of this.
- **A scheduling calendar and crew dispatch** — work is assigned to people, but there's no calendar view of who's where.
- **Purchase orders** — purchasing starts at the invoice.
- **Design and simulation** — buyers from design-led tools will expect shading/yield modelling.

- **Integrations** — no accounting/messaging/marketing integrations beyond file exchange, no published API.
 - **Multi-company operation** — a group running several installer businesses can't separate them within one install.
 - **Low-stock alerting** — stock is tracked accurately but doesn't warn.
-

About

Request a demo (primary conversion point, on every page)

Screens that look best in a product tour, in order:

1. **The delivery checklist for a live installation** — stage-by-stage, completed/pending/blocked items, documents attached where required, a named person per stage. The strongest single screen — should lead.
2. **The customer proposal document** — designed multi-page output, immediately understood by a non-technical viewer.
3. **The quotation builder** — configuration on one side, priced parts list assembling itself on the other, commercial position updating live.
4. **The survey on a phone** — a structured form on a real mobile screen with photos attached. The only genuinely "field" image — important for credibility.
5. **The personal work queue** — one person's overdue follow-ups, scheduled visits, pending documents. Sells accountability better than any dashboard.
6. **The operating dashboard** — pipeline, live installations by stage, overdue work, outstanding money. The owner's screen.
7. **The stock movement ledger across locations** — signals real operational depth vs. CRM-only competitors.
8. **The workflow template designer** — an admin composing stages/items. Sells configurability — a top differentiator.
9. **The report library** — 21 reports as a grid, then one report open.
10. **The partner portal** — a partner's own view of their enquiries and commission. Shows the product reaches outside the company.

A five-minute demo script

- 0:00 — The problem (30s): "120 installations in progress. Which one's stuck, at what step, whose fault? Most solar companies need a day and three phone calls to answer that."
- 0:30 — Answer it (60s): open the live installations list, filter to blocked work, open one job — feasibility done, documents outstanding, one rejected, assigned, waiting 11 days. "That took nine seconds."
- 1:30 — How the job got there (60s): the enquiry, logged calls, follow-ups, the completed survey — roof measurements, electrical details, location-stamped photos.
- 2:30 — The money moment (75s): build the quotation from that survey, parts list assembles itself at live prices, submit → approve, open the proposal — system, savings, payback, price, payment schedule. "This is what your customer receives an hour after the survey, not three days after."
- 3:45 — The handover (45s): mark accepted, convert — customer, project, advance, documents and the full checklist all exist in one action. "This is the handover that normally gets lost between sales and operations."
- 4:30 — Make it theirs (30s): open the workflow template designer. "This checklist isn't ours — it's yours."
- 5:00 — Close: "From first call to commissioning, one record, one process, and always an answer to what's blocked."

Ten candidate headlines

1. Know exactly where every solar installation stands.
2. The operating system for solar installers.
3. From enquiry to commissioning, in one system.
4. Your process, running itself.
5. Solar deals don't die at the quote. They die in the paperwork.
6. Quote in an hour. Not in three days.
7. Every installation, every stage, every owner — on one screen.
8. Built for solar. Not adapted for it.
9. Stop running your installation business on a group chat.
10. The ninety days after the sale are where you lose money. Fix that.

Vocabulary guide

Use — customer's language: installation · job · site visit · roof survey · proposal · quote · system size · parts list · stock · your process · stage · blocked · handover · commissioning · approval · paperwork · customer documents · what's outstanding · who owns it

Use — credible industry terms: rooftop solar · on-grid/off-grid/hybrid · net metering · kW · sanctioned load · feasibility · commissioning · DISCOM · bill of materials · payback period · EPC · channel partner

Avoid — internal/technical vocabulary: module · entity · record type · workflow engine · permission set · instance · deployment · schema · API · integration layer · platform architecture

Avoid — unsupported claims: design or simulation · monitoring/performance tracking · offline · "app" (it's a mobile website) · automated commission · automated subsidy claims · customer portal · e-signature · accounting software (it feeds one) · "AI-powered" as a product claim (the assistant is optional and how-to only) · real-time (current, not streaming) · multi-company · unqualified "enterprise-grade"

Avoid — tone: revolutionary · seamless · cutting-edge · game-changing · end-to-end (overused in this category) · any unverifiable percentage claim about time/cost saved. The buyer is a practical operator who's been sold software before — specificity beats enthusiasm.

Appendix — Glossary

Term	Meaning
Aadhaar	India's national identity number; commonly required as customer identity proof for subsidy applications
Balance of system (BOS)	Everything besides panels and inverter — cabling, protection devices, connectors, mounting hardware
Bi-directional meter	See net meter
Bill of materials (BOM)	The itemised parts list for a specific installation, with quantities
Channel partner	An external referrer (electrician, architect, builder, agent) working on commission
Charge controller	Regulates battery charging in off-grid/hybrid systems
Commissioning	Formal switch-on and certification after which a system legally generates
DISCOM	The regional electricity distribution utility; owns the grid connection, must approve any solar install
Earthing	The protective ground connection, mandatory for safety and inspection
EPC	Engineering, Procurement and Construction — designs, buys for, and builds an installation

Term	Meaning
Feasibility approval	The utility's confirmation a connection can support a proposed system
Hybrid system	Grid-connected but also able to store energy in batteries
Inverter	Converts panels' DC to usable/exportable AC; second most expensive component
kW	Unit of system size — a typical Indian home is 3–10 kW, commercial runs to hundreds
kWh	Unit of energy consumed/generated — what a bill is measured in
Load enhancement	Application to increase permitted electrical capacity, sometimes required before solar approval
MNRE	India's Ministry of New and Renewable Energy — governs the rooftop subsidy scheme and vendor empanelment
Mounting structure	The metal framework fixing panels to a roof
Net metering	Surplus generation exported and credited against consumption, requiring a net meter
Net meter	Meter recording both drawn and exported electricity; installed by the utility
Off-grid system	Independent of the grid, relying on batteries
On-grid system	Connected to and dependent on the grid, no batteries — the most common residential type
PAN	India's permanent tax account number; commonly collected as identity/tax proof
Panel / module	The photovoltaic unit; rated in watt-peak; the largest single cost line
Parapet	The low wall around a flat roof; affects shading and mounting
Payback period	Years of savings needed to recover installation cost

Term	Meaning
Rooftop solar	Solar generation on a building's own roof for its own consumption
Sanctioned load	Maximum electrical capacity a customer may draw under their utility connection
Shading analysis	Assessment of sunlight obstructions across the day/year
Site survey	The physical visit measuring roof and electrical connection
String	A series-connected group of panels wired as a unit into the inverter
Subsidy	Government support for residential rooftop installs, paid post-commissioning/inspection, subject to portal registration and an empanelled vendor
Tariff escalation	Assumed annual electricity price rise, used to project future savings
Watt-peak (Wp)	A panel's rated output under standard test conditions
Yield / generation estimate	Projected electricity output over a period, driving savings/payback figures
